

Pallet Shuttle

DAK's toughest challenges are combining high productivity and dense storage. Pallet shuttle systems (and their many nicknames) excel when it comes to high density storage and automated rearranging and retrieval of pallets.

A pallet shuttle system is a 24/7, 365-day operator and can in many cases eliminate traditional labor costs and costs associated with labor including, training, lift trucks and maintenance which can drive a relatively short term ROI.

Pallet Shuttle

Although the initial investment can be high, companies can benefit from an automatic pallet shuttle system when:

- High throughput is required.
- High product rotation exists
- Limited space is available and vertical space can be utilized
- You have a high number of stock counts and varying consumption SKUs
- Large number of pallets per SKU
